Transferring files between your Android mobile phone to your computer does not need to be a tedious or a difficult task. This article will take you through 3 different ways for wireless file transfer between your Android phone and your PC, without needing to use a USB cable. Here are the three Wi-Fi file transfer methods reviewed: Droid Transfer Cloud Solutions Bluetooth File Transfer Extra: Transfer files from PC to Android Wifi Transfer files from Android to PC: Droid Transfer Our most comprehensive solution comes first - Droid Transfer software. This option is for users who desire ease of use and an intuitive interface, as well as the ability to browse, copy, delete or add files to and from your Android device just like you would in Windows Explorer on your PC. Droid Transfer does not require your Android mobile phone to be rooted and will also save different types of data from your Android phone to your PC, such messages, music, photos, contacts, and more. Transfer files from Android to PC Wi-Fi - Here's how: Download Droid Transfer on your PC and run it. Get the Transfer Companion App on your Android phone. Scan the Droid Transfer QR code with the Transfer Companion App. The computer and phone are now linked. Select the files that you'd like to transfer from your Android device and hit "Copy to PC" in Droid Transfer. To add files from your PC to your Android device, click on Add File in Droid Transfer and choose a file on your PC you wish to add to your device. ✓Wireless file transfer ✓User-friendly interface ✓Transfer of many different data types ✓Locally stored data ✓Unlimited storage space Transfer Companion: Droid Transfer. Receive an email with a link so you can download the free trial on your computer. Note: We respect your privacy. We won't share your Email address with anyone else, or send you spam. Transferring files between Android phone and a PC: Cloud Services Another great way of transferring files between Android device and your computer is using a cloud service. Cloud Services such as Dropbox and Google Drive allow you to upload files from your computer, or phone, and then allow you to access those files from any of your devices. Bear in mind that your data will be stored externally, so it's not as secure as a simple file transfer between mobile phone and PC. This option is perfect if you plan on syncing files between your devices. File transfer Android - cloud services. Here's how: Go to your chosen cloud provider's website. Register for the cloud service. Most provide a free option which gives a limited amount of online storage, with the option to pay for more. Download the accompanying app on your phone, and set up with your account details. You can now transfer files between all of your devices, through your cloud storage. Summary (Cloud Services): ✓Wireless file transfer ✓Transfer limited data types ✓Externally stored data ✓Limited storage space Transfer files from Android to PC: Bluetooth The last method I'll mention is Bluetooth. "What is Bluetooth?", you may ask, and rightly so - the once popular Bluetooth has now taken a backseat to make way for more accessible Wi-Fi. However, there is still a place for Bluetooth for file transfer, as you can use it if you have no Wi-Fi. Bear in mind that not all devices will have Bluetooth available, especially some computers/laptops. Here's how it's done: Turn on Bluetooth on your computer and on your phone, and ensure that your device is discoverable. On your PC, go to your Bluetooth settings (you can search for "Bluetooth" in your Start menu). Select your Android phone from the list of devices, and pair. You may be prompted to enter a security code that will be provided, otherwise, you are paired (Image 1). You may also need to allow the receiving of files from your phone on your computer. If this is the case, you can find this option by clicking "Send or receive files via Bluetooth" on the right of the Bluetooth options on your PC (Image 2). Find the file you wish to transfer from your phone (eg a photo). Choose the "Share option". Share via Bluetooth and save to PC (Image 3). Image 1. Enter PIN Image 2. Send or receive files via Bluetooth Image 3. Share via Bluetooth and save to PC Summary (Bluetooth): ✓Wireless file transfer ✓Transfer limited data types ✓Internally stored data ✓Unlimited storage space ✓Does not require Wi-Fi Transfer files from PC to Android: Wi-Fi OK, here's some extra information for you hungry readers. If you want to transfer files from your PC to Android, you can use Droid Transfer as seen in Method 1. The tool allows you to transfer files from PC to Android using Wi-Fi or USB and vice versa. Publisher: Wide Angle Software Read Next: How to Transfer Music from your Phone to a PC > Device LinksAndroidMacDevice Missing?Modern technology has made us so accustomed to quickly receiving and sending data that it's important to know how to transfer files on a plethora of devices quickly. Sure, you could plug in your Android to your PC using a cable and move files the old-fashioned way, but that method is time-consuming and challenging to navigate.Instead, try wireless file transfers. Transferring files between PC and Android systems is quite simple once you learn how. While Apple users can use AirDrop to move files wirelessly between iOS and macOS, Android users need to think outside of the box. Just because Android file transfers require a third-party application, it doesn't mean they are impossible. Since it's easy to move your files without depending on a specific OS destination, you can transfer documents to both Windows and Mac, unlike AirDrop. If you're on the hunt for the best way to wirelessly move your computer files to Android, here are the top ways to do it. Transfer Files from Your PC to Android Using a Wi-Fi Network (WLAN) The best way to transfer files between your PC and Android is to send them over a shared wireless network. You can use many apps for this, such as Wi-Fi File Transfer on Android and Air Transfer on iOS. Some file browsers also incorporate Wi-Fi file transfers. Just open the app, browse, copy, and paste into the other device's folders. For file browsers, you generally go to the network section, WLAN section, or something similar. It searches for available devices, and you select the device you need. Transfer Files Using a Wireless Media Reader Devices that are increasingly handy for managing media include portable NAS (Network Attached Storage) drives and wireless media readers. These devices get loaded up with media via an SD card or USB drive, which can then be accessed by connecting to the device's Wi-Fi hotspot. The key features of NAS drives or wireless media readers are the ability for multiple users to access them at once and the fact that they get used independently of an internet connection. Most of them can also act as a power bank to keep your phone or tablet going for more extended periods. Transfer Files Between Android and PC Using Bluetooth In the early days of smartphones, Bluetooth was the perfect way to swap small amounts of data. While it's not ideal for bigger-sized downloads, it remains a convenient way to transfer files. Since most current-generation laptops are Bluetooth enabled, it's also a snap to set up. Make sure your PC's Bluetooth is on. If active, you'll see the icon in the System Tray. The icon will also display in the Action Center whether Bluetooth is on or off. Once Bluetooth is enabled, right-click the icon in the System Tray and select Add a Bluetooth Device. In the Bluetooth Settings window, select Add Bluetooth or other device. In the Add a Device popup menu, select Bluetooth to search for your Android device. On Android, you may need to open your Bluetooth settings and hit the refresh icon to reactivate search-and-find functionality, or Windows won't discover it. Click on the device when it appears. You may also need to select the PC name on the Android device while Windows attempts to connect. Your PC will then show you a code to ensure that you're connecting to the right device, which should also appear on your smartphone or tablet's screen. Verify that the codes match, and then select Yes. Once you've clicked next, the two devices should pair, ready to swap files in the same way you would between two mobile devices. Transfer Files Between Android and PC Using Cloud Storage Google Drive and Dropbox are still some of the best options for wirelessly moving data. Both options are platform-agnostic and accessible from anywhere with an internet connection, making for an easy way to share multiple files or folders with minimal fuss. Since Google Drive comes pre-installed on Android, we'd recommend that as your first stop. That said, if you prefer Dropbox, both apps work almost identically. The only drawback is the limited storage space on Dropbox's free tier, but if you're syncing a small number of files, it shouldn't cause you much trouble. Transfer Files Between Android and PC Wirelessly Using Email Finally, email is often the go-to solution for quickly sharing photos or documents with friends and co-workers, and for a good reason. It may be getting a little old but emailing yourself the desired attachments is still a great way to swap files between your PC and your Android device. Depending on the email service you use, there may be a cap to how much you can send. Sending an email with documents attached should work, but don't expect to spend hours sending video footage without issues. Frequently Asked Questions Transferring files between your Android and PC should be hassle-free and without limitations. If you have more questions, keep reading. How do I transfer large files between my PC and Android? If you have large files to transfer, but the methods above aren't working for you, you'll need to resort to another option. Your best bet is to use your phone's charger and transfer larger files via USB. The process is fairly simple. - All you need to do is plug your phone into its charger, and the USB end into the USB port on your PC. - Then, a pop-up will appear asking if you'd like to allow your computer to have access to your phone. Approve any permissions required and you're all set! If you run into problems, it's likely because you'll need to turn on USB debugging on your phone. That process is simple too! - Just open the Settings on your Android device and search for Build Number (typically located under About Phone > Software Information). - Tap Build Number seven times to unlock your devices' developer options. - Then, head back to Settings, tap on Developer Options, and toggle the switch next to USB Debugging on. Are there any third-party applications that help transfer files between devices? Absolutely! Where Windows and Android fail, third-party services come through to help. You can do a quick search for an app that meets your specific needs or use a more popular service such as Droid Transfer or Dr. Fone. Network File Transfers There are numerous ways to transfer files between your PC and Android device wirelessly. For small files, the simplest method is to use email, Bluetooth, or a portable NAS device. When transferring larger files, you'll want to use a NAS device, portable or otherwise. How do you transfer files from your PC to Android? Please feel free to share your suggestions and solutions in the comments below.
